

PERFORMANCE REPORT

CS-PFR-15-3 Augean North Sea Services provide High Pressure Cleaning services.

Shell required Augean North Sea Services (ANSS) to provide an innovative and supportive approach to the end of well OBM clean up at the end of SW01s1 on-board the Noble Hans Deul.

Historically there had been previous attempts with limited success at cleaning the built up residues inside the mud pump's 16" pipework. These efforts had been both time consuming and labour intensive and resulted in additional rig time.

The ANSS offshore supervisor proposed that a new approach could be introduced and suggested the provision of high pressure jetting to clean the built up residues.

Following agreement from Shell, ANSS planned and mobilised the required equipment and personnel in a timely manner and despite the associated risks with operating with high pressures, the cleaning was undertaken in a compliant, safe and controlled manner. The operation of this equipment by the

competent Augean crew in conjunction with the containment equipment already on-board saved 12 hours of rig time for Shell compared with the previous cleaning times.

This was captured by Shell and will now become standard methodology for this activity during the end of well OBM clean up on-board Noble Hans Deul.
